Can fiberglass tail be bent

Overview

In this guide, we'll break down the reasons behind this limitation, explore safe workarounds, and help you plan your projects more effectively when using fiberglass rebar. Fiberglass rebar can be bent, but requires adherence to strict technical parameters and specialized procedures. Unlike steel rebar's ductile behavior, GFRP exhibits brittle characteristics that can result in 40-60% strength reduction when bent improperly. This is one of the most common questions contractors ask when they first work with GFRP rebar (glass fiber–reinforced polymer rebar). But as engineers and builders transition from traditional steel reinforcement to fiberglass-reinforced polymer (FRP) bars, one practical question keeps coming up: Can fiberglass rebar be bent like steel?

The short answer: no, and trying to do so could be a costly mistake.
