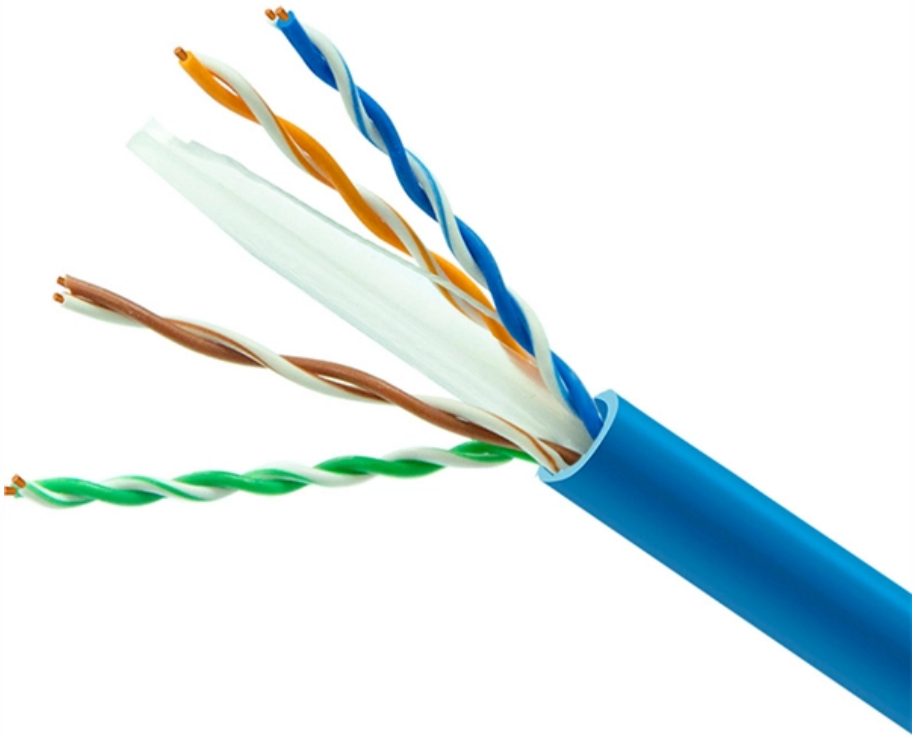
FRINDEL OPTICS

Which ceramic core insert model is recommended



Overview

Negative geometries prevail if up-milling is necessary, resulting in thick chips at the exit. Carefully select insert geometry, insert grade, insert shape (nose angle), insert size, nose radius and entering (lead) angle, to achieve good chip control and machining performance. PCD turning inserts are designed for high-performance turning of non-ferrous metals and composites. This includes aluminum alloys, brass, carbon fiber, fiberglass, composites and wear-resistant plastics. PCD is an advanced material, similar to CBN, made by bonding selected diamond particles. Second to only synthetic diamond on a scale of hardness, PCBN is characterized by its innate durability, as well d ceramic grades for HPT (Hard Part Turning). Sialon and whisker ceramics are viable alternatives for both turning and milling of heat-resistant super alloys (HRSA).

Ceramic Tool Inserts

Ceramic tool inserts are cutting tools made of ceramic materials. These inserts offer high hardness, wear resistance, and thermal stability, making them suitable for machining hard and brittle materials.
