

Are fiberglass rigid tails prone to breaking

Overview

They're typically made from durable, flexible materials like fiberglass or graphite, which can bend significantly under load without breaking. Additionally, the tapered design helps distribute the stress along the length of the rod. Fiberglass is renowned for its high strength-to-weight ratio, making it lightweight and incredibly durable. Unlike rigid materials prone to snapping under pressure, the inherent flexibility of solid fiberglass rods is a testament to their durability. However, the lasting period partially depends on your ways of using them too, if you store and preserve them appropriately, even.

Are fiberglass rigid tails prone to breaking

Hard Tail bikes are they safe?

Hi Everyone, I am a consulting engineer and I have been asked to certify a few hard tails in the area because of issues with registration. The bikes requiring certification are OEM bikes (older
