Overview

As you suspect, for any one access point and its associated client stations only one frame may be successfully transmitted at a time and collisions do happen; this is like an Ethernet hub. Network Switch: A switch is a physical device used to connect multiple devices on a local area network (LAN), facilitating communication by forwarding data packets to each MAC address of connected devices in an efficient manner. This article explains how to apply VLANs to switch ports, focusing on trunking/trunk ports and access ports. Some of the other features (like VLANs) and the BVI interface make it more switch-like.
