

# Check the status of the core switch

## Overview

---

If you are only interested in the switch uptime and last reload, you can run a more direct command using the pipe "|" feature built into Cisco IOS XE (and Cisco IOS) software. These commands give you general details about your switch, like the software it is running, how long it has been powered on, and what hardware is installed. Switch ports (interfaces) are where devices like computers, servers, or other switches connect. Below are some useful commands that can be used to diagnose and troubleshoot Livewire problems within a Cisco switch.

## Check the status of the core switch

---

### Use displaycpu commands to ensure core switch Security

The following describes how to use the displaycpu command to view the working status of the core switch plug-in card:
