

Determination of Dynamic Friction Coefficient of Fiber Optic Cable

Overview

This part of IEC 60794 describes test procedures to evaluate the coefficient of dynamic friction of the sheathing material of a cable when pulled over or between other cables. How does this large, blue-colored wheel help us as a lubricant manufacturer?

The reel test has proven to be a. For a given technique, cable construction, installation method (pulling, pushing, or blowing), and duct size, the relative values of the COF can give some indication as to the relative ease of. Several new methods of installing fiber optic cable in continuous conduit use high speed air flow to "push" the cable, rather than the traditional threaded line to pull it.

Determination of Dynamic Friction Coefficient of Fiber Optic Cable

Measuring Cable Pulling Friction with a Reel Test

Polywater's reel test determines the effect of cable fill on cable pulling tension and is used in analyzing fiber cable installations and developing lubricants.
