

Do optical modules have A-ends and B-ends

Overview

An optical module is a typically hot-pluggable optical transceiver used in high-bandwidth data communications applications. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa. This ensures consistent Tx/Rx matching across all connections, making it possible for complex network systems to operate without interruptions. This document focuses on projection optical modules that incorporate Texas Instruments' DLP Display chips and are designed to project an image onto a surface for a variety of applications, including smartphones, tablets, display projectors, smart home displays, digital signage, AR glasses, and.

Do optical modules have A-ends and B-ends

Polarity Basics

A general optical link requires two optical fibers to complete the entire transmission process. For example, the optical module has a receiving end (Rx) and a
