

Fiber Optic Cable Triple Network Integration

Overview

The so-called triple play is to provide an ideal low-cost FTTH or FTTB (data, voice and CATV) access solution. Triple Play refers to the integration of three networks: high-speed broadband Internet access, television (primarily IPTV, but also CATV in some cases), and latency-sensitive telephone services (primarily VoIP, but also traditional POTS). Triple Play Service refers to a business model that utilizes a unified IP network infrastructure to integrate the traditionally independent three major networks and their services (voice, video, data)—telecommunications, cable television, and the internet. JUNPU provides complete fiber optic solutions for Triple Play Network (voice, data, video). Explore our ODN products (EDFA, Splitters, Closures) that ensure high-bandwidth & reliable convergence. Modern fiber optic system integration requires the intelligent combination of Fiber optic product matrix 2025 to create holistic network solutions.
