

# **How are the two data centers interconnected**

## Overview

---

A data center interconnect (DCI) is similar in theory to a cross connect but uses electronics, typically DWDM, to establish a point-to-point connection between two data centers so they can share resources or improve other operations such as load balancing. Cross Connects provide dedicated, point-to-point connectivity as well as the most reliable, efficient, and. Data centers are the backbone of the internet and corporate IT infrastructure, housing vast amounts of data and supporting critical applications and services.
