

# Optical Module Identification Methods

## Overview

---

Optical modules are usually affixed with labels covering information such as manufacturer, production date, module type, transmission distance, and serial number to help customers identify them. Siemens' response to these requirements is SIMATIC Ident, a uniquely comprehensive and scalable portfolio of RFID and optical read systems for the flexible implementation of efficient, economical identification solutions in manufacturing and logistics. Nonbinary modulation with coherent detection maximizes spectral efficiency and improves tolerance to transmission impairments, while enabling effective, low-complexity electrical compensation of these impairments. The Transmitter Optical Sub Assembly (TOSA) is responsible for the emission of light. Integrated circuits and reference designs help you create a smaller and faster optical module design used in high-bandwidth data communication applications. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. If you can measure the density of a material, easure of how much light propagates through a medium.
