

Requirements for the thickness of the protective layer of cable trays

Overview

Carbon steel used for cable trays shall be protected against corrosion by the following processes: Hot-dip galvanized zinc after fabrication in accordance with ASTM A123/A123M, Coating Grade 65 with an average zinc coating weight of 460 g/m² per side or coating thickness of 0. The mechanical and electrical characteristics, tests, certifications, overall quality management, recommendations mentioned in this technical guide only apply to our own cable management ranges and cannot under any circumstances be transposed to si osure, overheating or. Mechanical Strength The cable tray must withstand the load of cables, environmental factors, and external pressure. Is your cable tray system optimized for safety, dependability, space and cost savings?

Cable tray (or cable ladder) systems are a popular alternative to electrical conduit systems, as they have an outstanding record for dependable service, design flexibility and cost savings in commercial and. maintain spacing or to keep cables in place when the tray is ect the minimum bend ra-dius for cables as they exit the bottom of the cable tray. When the width of the molded enhanced ladder frame in the thickness standard is greater than 150mm and less than or equal to 400mm, the thickness of the side plate should be at least 1.

Requirements for the thickness of the protective layer of cable tray

CLASSIFICATION NOTES

Cable trays/protective casing and joints should be assigned a Safe Working Load (SWL) satisfying the following criteria, tested at the declared temperatures according to 1.2 above (See note):- the
