

What are the cable trays used for wiring in the basement called

Overview

Wire mesh cable trays—often called basket trays —are constructed from welded steel wire, forming a lightweight open-grid structure. Unlike traditional formed trays, wire mesh trays rely on distributed wire intersections for strength rather than solid rails or rungs. There are several types of cable trays, including ladder, perforated, solid bottom, basket, and channel trays. Cable tray systems are engineered support structures designed to route, support, and protect insulated electrical cables used for power distribution, control, instrumentation, and communication.
