

What does 6-core single-mode optical cable mean

Overview

The standard six-core single mode fiber optic cable uses the most common design of single mode fiber where the core diameter is approximately 8-10 microns with a cladding diameter of 125 microns. This design supports long-distance transmission with an attenuation level of about 0. Considering the cost, building a single-mode optical cable is actually to pull a 6-core single-mode optical cable to the optical node. If you need fiber optic cable, teens will often say 67 while making a hand gesture as if they're weighing things on a balance. For months now, everyone's FYP has been taken over by the random number, which is either written as "67" or "6-7" – but what does it mean?

! It's blown up on social media even more this week, so here's a full explanation. Former FBI director James Comey was made the subject of an arrest warrant by the Department of Justice for allegedly calling for the assassination of Donald Trump - by posting a picture of sea shells on Instagram.
