

# **What elements does a spectrometer analyze**

## Overview

---

A spectrometer is a scientific instrument used to separate and measure components of a physical phenomenon. Spectrometers are used in astronomy to analyze the chemical composition of stars and planets, and spectrometers gather data on the origin of the universe. The word "spectrum" refers to the range of wavelengths or frequencies of electromagnetic radiation, which includes visible light, ultraviolet (UV) light, infrared (IR).

## What elements does a spectrometer analyze

### Spectrometer

A spectrometer is a scientific instrument used to separate and measure spectral components of a physical phenomenon. Spectrometer is a broad term often used to describe instruments that measure a continuous variable of a phenomenon where the spectral components are somehow mixed. In visible light a spectrometer can separate white light and measure individual narrow bands of color, called a spectrum. A mass spectrometer

### **Spectrometer**

Spectrometers are used in astronomy to analyze the chemical composition of stars and planets, and spectrometers gather data on the origin of the universe.

[Contact Us](#)

### **What does a spectrometer do?**

A spectrometer is a scientific instrument used to measure and analyze the properties of light. It breaks down light into its component colors or wavelengths, allowing scientists to study the spectrum. This
