

# What is an optical cable open terminal

## Overview

---

An ONT is a device that translates light signals sent through fiber optic cables into data that your devices can understand and use. Learn all about ONTs, how they work, and why they're a critical link in the "last mile" of fibre networks. What is an optical network terminal (ONT)?

How does an ONT work?

What is the difference.

## What is an optical cable open terminal

### Signal

A common example is signal transmission between different locations. The embodiment of a signal in electrical form is made by a transducer that converts

### Optical Network Terminals Selection Guide: Types,

Optical network terminals (ONTs) are essential endpoint devices in fiber-optic communication systems, responsible for converting optical signals from fiber

[Contact Us](#)

### Defining ONT: Optical Network Terminal

It acts as an interface between the fiber-optic network and the user's equipment, converting optical signals transmitted via fiber optics into electrical signals that can be used by household or business
