

# **Where to connect the uplink of the optical splitter**

## Overview

---

First, choose the right splitter based on the number of devices to be connected. Next, connect the main fiber line from the control center to the input port of the splitter. Indoor options encompass locations like the community's central computer room, building's weak current well, or floor wiring box. However, connecting one splitter to another—also known as cascading splitters—can be tricky. A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one. Unlike active devices (which require power), splitters operate without electricity, relying solely on the physics of. This point-to-multipoint architecture helps reduce space occupation and effectively save optical cable resources, achieving efficient network expansion at a lower cost.

## Where to connect the uplink of the optical splitter
